Tutorial 9
Friday, January 15, 2016

Problem 1. *(Lamports protocol)* Discuss the following properties of Lamport's protocol:

a) Show that the one-way function is not required to be secret.

b) Which properties must a hash function fulfill to be usable as a one-way function in the protocol?

c) Propose a function that could be used as the one-way function, assuming that the discrete logarithm is hard to solve in $\mathbb{Z}_p^*$ for a usable p. Describe Lamport's protocol for this special case.

d) How can an attacker get access to a one-time password using an active attack?

Problem 2. *(attacks on identification schemes)*

a) Describe a replay attack for a fixed password identification.
Propose a simple identification scheme to prevent this attack.

b) The following challenge-response mutual authentication protocol is given

 1) $A \to B : r_A$
 2) $A \leftarrow B : E_K(r_A, r_B)$
 3) $A \to B : r_B$

 Explain how an eavesdropper E can authenticate to A without knowing the symmetric key K. This a reflection attack. Propose an improved protocol.

c) The following challenge-response protocol based on digital signatures is given

 1) $A \to B : r_A$
 2) $A \leftarrow B : r_B, S_B(r_B, r_A, A)$
 3) $A \to B : r'_A, S_A(r'_A, r_B, B)$

 Explain how an eavesdropper E can authenticate to B without signing any message with his own identity. This is an interleaving attack.
